UAE HACKATHON 2026 · CHALLENGE #27 · PROPOSED MODEL

Business Model Canvas وكالة

WAKALA — an independent authorization, monitoring and recovery layer for government AI agents. Every partner listed is a target. No partnership, customer or price has been agreed.

Key partners (targets)

- Central digital-government authority: shared-service channel and interoperability standards
- National cybersecurity authority: alignment with national cyber guidance and incident coordination
- Agent-platform and model providers: adapters so their agents sign requests
- System integrators already serving government entities
- In-country cloud and key-management / HSM providers
- Independent security testers for third-party assurance

Key activities

- Operate and harden the gateway, mandate and delegation engine
- Build service and platform adapters
- Write mandate templates with service owners
- Continuous red-teaming (Attack Lab corpus)
- Officer training and recovery drills

Key resources

- Working prototype: gateway, signed mandates, delegation chains, Behaviour Watch, audit chain, Document Shield, Shadow Mode
- 493-test suite and reproducible evidence harness
- Attack scenarios and synthetic benchmark dataset
- Security engineering and government-service know-how

Value propositions

- **Prove** every agent action was authorized: who acted, for which citizen and case, under whose mandate
- **Prevent** out-of-mandate actions before they run (synthetic benchmark: 0/720 unauthorized executed, 0/480 legitimate denied)
- **Stop one agent, not the service:** selective suspension, officer reassignment, safe recovery
- **Platform-neutral:** sits at the service API, so different agent vendors meet one standard
- **Safe adoption path:** Shadow Mode predicts the impact before anything is enforced
- Plain-language AI-activity receipts for citizens

Customer relationships

- Pilot co-design with the service owner
- Dedicated onboarding and mandate-template workshops
- Shared incident and recovery playbooks with the entity's security team
- Conformance testing for platform suppliers

Channels

- Challenge owner → a 90-day pilot
- National shared-service and procurement frameworks
- System-integrator partners
- Direct sales to entities with agentic AI programmes

Customer segments

- **Primary:** ministries and authorities deploying AI agents in citizen services (accountable service owners, CISOs, CDOs)
- **Central:** digital-government and cybersecurity authorities that need cross-entity assurance and evidence
- **Suppliers:** agent-platform vendors and integrators that must show equivalent protection
- **Later:** sector regulators for high-impact services

Cost structure

- Engineering: production hardening (HA, durable database, external audit anchoring)
- In-country hosting, key management and HSM
- Independent penetration testing and certification
- Integration and support staff; officer training
- Licence review: PyMuPDF is AGPL, so a commercial licence or replacement is needed before commercial use

Revenue streams (proposed)

- **Entity licence (annual):** tiered by number of protected services and registered agents
- **Fixed-scope pilot fee:** 90-day pilot on one service
- **Supplier conformance kit:** test suite and evidence pack for agent-platform vendors
- **Integration and assurance services:** adapters, mandate templates, recovery drills
- *Price levels are not set. They will be validated with the pilot entity. No revenue or market-size figures are claimed.*

Figures cited come from evidence/phase5/summary.json (synthetic prototype benchmark, not production government statistics). WAKALA is a prototype and is not integrated with any government system.
