UAE HACKATHON 2026 · CHALLENGE #27

Demo runbook وكالة

Run the live prototype for Q&A, a judges' booth or a backup. The 3-minute pitch uses the slide 4 screenshots and needs no live demo.

1. The night before (one-time setup, about 10 minutes)

```
powershell -ExecutionPolicy Bypass -File scripts\bootstrap.ps1
```

Issue the officer passwords. Each is **shown once**, so write it down on paper and do not put it in any file or slide:

```
cd backend
.venv\Scripts\python -m app.devtools.cli officers set-password OFF-0101
```

```
cd backend
.venv\Scripts\python -m app.devtools.cli officers set-password OFF-0900
```

Rehearse the whole flow below once. Then click **New demo session** so the portal starts clean. This deletes nothing, and the audit history is kept.

2. On the day (start about 15 minutes before)

Step	Action	Check
1	Terminal 1: `cd backend` then `.venv\Scripts\python run_dev.py`	Backend starts on port 8000
2	Terminal 2: `cd frontend` then `npm run dev`	Vite serves http://localhost:5173
3	Open **http://localhost:5173/portal**	Header shows "Enforcement engine: connected"; footer shows "API online"
4	Check the assistant label	"deterministic offline planner (no AI model)". This is the default and needs no internet
5	Turn on Do Not Disturb; set the browser zoom to 100–110 %	
6	Have `submission/WAKALA_Pitch_Deck.pdf` open as a fallback	

3. Live flow (about 4 minutes; use any part of it)

Route: **/portal** → Presenter panel ("Guided demonstration").

#	Where	Click	What to say / what appears
1	/portal, Scene 1 *Normal service*	**Send "I want to renew my res…"**	Six signed steps are allowed; the case reaches COMPLETED with an AED 500 synthetic receipt. "Every step was checked by the gateway."
2	Scene 2 *Cross-citizen incident*	**Run the unauthorized request**	"Blocked: this AI agent was authorized to check insurance for Mariam, not another citizen's record (C-1003)." The case shows PAUSED_FOR_REVIEW; nothing was charged.

#	Where	Click	What to say / what appears
3	Scene 3	**Open Security Operations** (or *Open Security Operations side by side* in the header)	/soc opens. **Sign in** as `OFF-0101`.
4	/soc → **Incidents** tab	Open the HIGH `CROSS_CITIZEN_ACCESS` incident	Violated rule, gateway evidence, verified chain: roots AUTHORIZED, the child mandate SUSPENDED.
5	Same incident	**Mark under review** → **Reassign …** → **AGT-INS-002** (the standby agent) → **Resume case**	"Only one delegated mandate was touched. Nothing agent-wide."
6	Back on /portal	**Continue my case**	The new delegation is **held** for an officer. Nothing ran yet.
7	/soc → **Approvals**	**Approve & re-authorize**	The stored signed request is re-checked (ALLOW_WITHIN_MANDATE) and executes once.
8	/soc → **Incidents**	**Resolve incident**	
9	/portal	**Continue my case**	"Your residency renewal is complete — recovered after a security review." The unrelated case line shows COMPLETED.
10	/portal	**My AI Activity**	Citizen receipt: 3 agents, 1 delegated task, 1 blocked request (no data returned), the officer review.
11	/portal, Scene 4	**Attach hidden-text PDF**	Document Shield marks the PDF QUARANTINED; the hidden-layer finding is shown. Optionally **Inspect in Document Shield**.
12	**/attack-lab**	**Run all 8**	Summary tiles: 8 run · executed without WAKALA **7** · with WAKALA **0** · denied in both **1**.
13	**/evidence**	Scroll to the before/after recovery panel	1,200 requests; 0/720 and 0/480; recovery 2/20 → 20/20. Say "synthetic benchmark".
14	Optional: **/shadow**	**Run shadow evaluation, then enforcement**	11 events; predictions matched enforcement 11/11; source state unchanged.
15	Optional: **/delegation**	Case View	Citizen request → Residency Agent → delegated Insurance Agent → services, with the recovered state.

Officer roles: `OFF-0101` is the residency case officer (recovery). `OFF-0900` is the supervisor (the **Revocation** tab). `OFF-0950` is the read-only auditor: the API refuses its actions with 403, which is useful to show role separation.

4. If something goes wrong

Problem	Fix (≤ 30 s)
Backend or frontend will not start	Present slide 4 and the `submission/screenshots/` folder. They are genuine captures of the same flow
"Session expired or was revoked" notice on /soc	Sign in again; the work is kept
Forgot an officer password	Re-run `officers set-password OFF-0101` (this ends existing sessions)
Case stuck after step 6	It is waiting in **Approvals**: approve it, resolve the incident, then **Continue my case**
Want a clean slate	**New demo session** (top right of the presenter panel). Nothing is deleted
Venue Wi-Fi down	Nothing is needed. The default planner runs offline. If a model was configured and is unreachable, the portal falls back to the labelled offline planner before any gateway step

Problem	Fix (≤ 30 s)
Judge asks for a live AI model	Explain honestly: no model credential was configured and no live model run is claimed. The *Real-model injection test* button reports "not run" instead of faking a result

5. Do not

- Do not type real personal data into the portal. It is a synthetic, developer-mode demo with no citizen login.
- Do not show terminals that contain officer passwords.
- Do not describe the benchmark as government statistics, or the prototype as production-ready.
